<p>Document 1 cited in the international search report sets forth an error detection device which simultaneously carries out error correction and error detection on object code strings made up of a plurality of sectors comprising matrix-shaped data, having a means of updating calculation results of an error detection code calculation based on error correction results. Document 1 also indicates that scrambling caused by calculation results of the updated error detection codes is removed.</p> <p>In addition, document 2 cited in the international search report (see in particular the section relating to [fig. 23]) sets forth a object code string made up of a plurality of sectors comprising matrix-shaped data,</p>

having a means which carries out an offset calculation (corresponding to the "skip calculation" of this application) when inputting in a discontinuous arrangement (PO direction).

However, documents 1 and 2 neither disclose nor suggest the features unique to this application, wherein "the aforementioned error detection code skip calculation circuit inputs the object code string error detection signal inputted up until the previous occasion, and of these object code strings", "in the final line of the aforementioned sector, performs an individual skip calculation which skips the number of bytes according to the string position in which said data exists, and said individual skip calculation uses on a number of occasions the calculation results of the skip calculation which is carried out at a specific string position among string positions where the aforementioned data exists."
